## Point

The axes of a two-dimensional Cartesian system divide the plane into four infinite regions, called quadrants, each bounded by two half-axes. These are often numbered from 1st to 4th: where the signs of the (x;y) coordinates are I (+;+), II (-;+), III (-;-), and IV (+;-).

Given N points. Check that there is a point after removal of which the remaining points are located on one side of quadrant.

### Format Input

The input begins with an integer T indicating the number of test cases. In each test case, the first line contains a single positive integer N, the number of points. The following N lines contain coordinates of the points. The i-th of these lines contains two single integers  $x_i$  and  $y_i$ . No two points coincide.

### Format Output

For each test case, output YES if there is such a point. Otherwise, output NO.

### Constraints

$1 \leq T \leq 100$

$1 \leq N \leq 1000$

$1 \leq |x_i|, |y_i| \leq 1\,000\,000$

Sample Input (standart input)	Sample Output (standard output)
2 4 1 1 2 2 -1 -1 -2 -2 3 -1 1 -2 2 -3 3	Case #1: NO Case #2: YES
